### Presentation

This conference explores what happens to color when objects, images, and styles circulate across time, space, cultures, and media. While art history has advanced our understanding of color's material and symbolic dimensions, less attention has been given to how circulation and transfer shape coloration, or to the role of reproduction – whether in black and white or in color – in mediating artworks, their reception, and the transmission of practices and styles.

Shaped by time, chemistry, circulation, techniques, transmediality, and cultural diversity, color is far from stable – especially as images travel across geographies and media. More than a property, color acts as an agent of transmission, transformation, and sometimes erasure. To think about color through circulation is to address the epistemology of reproduced images, their technical regimes, and historical effects.

The event concludes the research project Visual Contagions (Swiss National Fund, 2021–2025), conducted at the University of Geneva, in collaboration with the ArtI@s project.
