Site Responsiveness. Translocal Interdependencies and Heterogeneous Temporalities in Art and Architecture.

It is a widely shared diagnosis that translocal connectivity and interdependence of events are defining characteristics of our present. Beyond increasingly powerful infrastructures for the transport of goods and data, and a globally synchronized information sphere, this condition is shaped by the destabilization of both the planetary and many local ecosystems. Against this backdrop, the concept of the site requires a fundamental revision. Sites can no longer be understood as fixed anchor points or stable stages for events. Instead, they are nodes where diverse but interdependent processes overlap – ranging from high-frequency digital data flows to slow ecological transformations.

This conference explores how art and architecture have responded to this dynamism and translocal interdependence. Since the 1960s, “site-specific” approaches have evolved from mainly material and spatial definitions toward social, ecological, and infrastructural conceptions. We focus on cases in which the complexity of the site becomes fully operative, foregrounding the multiplicity and heterogeneity of the forces that constitute it.

Shifting from site specificity to site responsiveness, the conference highlights practices that do not simply adapt to sites but actively reconfigure the processes that shape them – creating new couplings, exposing tensions, or seeking forms of mediation and recalibration. Responsiveness encompasses both critical exposure and dialogical engagement within a fragile, more-than-human world. Our aim is to test responsiveness as an analytical category in artistic, architectural, and urban practices, with particular emphasis on translocal relations and heterogeneous temporalities. The conference fosters an interdisciplinary exchange to explore how these practices register, intervene in, and reconfigure the complex relations that define the contemporary sites.
